

1. Launch an EC2 instance in North Virginia region. Select t2.micro, add tags
2. Download pem file
3. Set the permissions of pem file as read(chmod 400) or read and write (chmod 600)
4. Ssh into the instance and run sudo apt-get update
5. Install apache2 server- for hosting http website - sudo apt-get install apache2
6. Start the apache2 service - sudo service apache2 start
7. Go into /var/www/html/index.html. It is the default apache2 test page (chown is used to get root ownership)
8. Go into security group of the instance and open port 80, the http port
9. Copy the IP or the public DNS url and paste it on the browser, the test page will open
10. Create index1.html- eg. helloworld and save it
11. Repeat step 9 but with IP/index1.html
12. The html page will show up the one written in index1.html
13. For snapshots we create snapshot, name it and it asks where is the snapshot to be copied - we mentioned Oregon- snapshot is named as Akash-snap-1

```
